-
- Time recording by browser, app or telephone
 - Easy and simple to use
 - Offline-capable
 - Compatible with PCS's INTUS COM communication software
 - Web capture with single sign-on via the Active Directory
 - Also via the Apple Watch
-

Time for security.

Since the ECJ ruling in 2019, recording working hours has been mandatory for all companies. A digital solution is ideal, especially for field staff and colleagues working from home who are not on site, in order to avoid the effort and disadvantages of manual documentation. The INTUS FTC mobile solution is the perfect complement to stationary time recording and enables bookings to be made via PC, mobile phone, smartphone or telephone, regardless of location.

INTUS FTC offers various options for mobile time recording: The system can be operated via a telephone connection using VoIP, ISDN or an analogue telephone. Alternatively, working times can be booked on any internet-enabled device such as a PC, tablet or smartphone via a standard web browser. A native app for Android and iOS devices further increases flexibility.

Time recording via data connection

Several flexible options are available for time recording via a data connection: Either bookings are made via a web browser or via a native app for Android smartphones, iPhones/iPads and Apple Watches. The web-based time recording works with all common browsers and is platform-independent. This means that users can use PCs, laptops, tablets or smartphones - regardless of the operating system, be it Windows, iOS, Android or Linux. Thanks to HTML5 programming, no additional software installation is required and Java is not needed.

INTUS FTC not only offers offline capability, but also enables the location to be transmitted if required, so that the user's current position can be recorded when bookings are made. The solution also supports single sign-on (SSO) through integration into Microsoft Active Directory.

For even greater flexibility, INTUS FTC is also available as an app for Android smartphones and tablets, iPhones/iPads and Apple Watches. The connection to the T-Server can be established both via a voice connection (telephone) and via a data connection. Thanks to the automatic IMEI assignment, bookings can be made without manually entering the ID number. Optionally, you can specify that bookings can only be made from devices with a specific IMEI number. The native app also enables the recording of GPS-based location data, the transmission of which can be deactivated if required by withdrawing location authorisations.

INTUS FTC

Time recording via telephone connection

With time recording by telephone, the caller is conveniently guided through the booking process via an interactive voice system. Employees can record their coming and going times as well as specific business trips such as doctor's appointments or visits to the authorities with a simple phone call. The telephone numbers that can be used to book working times can be flexibly managed and restricted using blacklists and whitelists. This method of time recording is cost-efficient and reduces the need for time-consuming manual corrections in the system. Depending on the configuration, it is even possible to make bookings free of charge without the need to establish a connection.

System requirements

INTUS FTC T-Server

- Operating system: Microsoft Windows Server 2016 or newer
- Min. 8 GB memory
- For ISDN: one free PCI/PCIe slot for telephony board
Telephony board: Fritz!Card PCI or Gerdes ISDN
- Database: Microsoft SQL Server 2016 or newer
Microsoft SQL Server Express Edition is supplied with

WebTimeRecording

- Standard browsers such as Chrome, Edge, Firefox, Safari or Opera
- MS Internet Information Services (IIS) web server to be supplied and configured by the customer

Apple Watch App

- Only via WiFi connection
- An iPhone connection is required for Internet access
